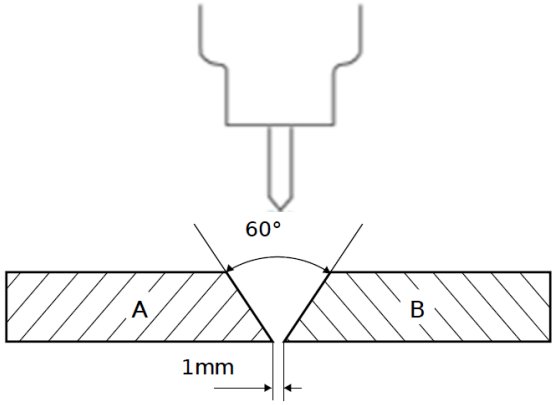
The test weld, that is closest to the selected simulation, is this *Single pass V joint in 3 mm sheet thickness*

Base material	Thickness mm	Joint	Joint preparation	Welding process	Filler metal	Shielding gas	Backing gas
LDX 2101 EN1.4162	3	V	Joint angle 60° Gap 1 mm	GTAW (TIG)	22 9 3 NL Solid wire 0.8 mm	MISON N2*	Nitrogen

*MISON N2 (Ar+30%He+1.8%N_2+0.03%NO)

Joint preparation



The joint angle was 60° (bevel angles 30°) and the root gap was 1 mm.

The test weld was intended as a complete single pass weld.
Welding position PA. The electrode diameter was 2.4 mm.

Welding current A	Voltage V	Heat input kJ/mm	Wire feed speed m/min	Welding speed cm/min	Number of passes
130	11.1	1.1	0.55	5	1

Measured ferrite fraction in the weld (the rest is assumed to be austenite), and the ferrite fraction more in detail in different regions of the weld, are shown in the table below. The fraction is measured using image analysis.

The ferrite fraction is an average value based on several measurements using image analysis in each location and the standard deviation in average values were around 5%.

Heat input kJ/mm	Weld	Top of the weld	Middle of the weld	Bottom of the weld
1.1	72%	74%	73%	70%

Nitrides and sigma phase were not analysed in this weld.
